

Realistic head: fsaverage cortex, 30 nAm patches of geodesic radius 20 mm (median area 10.6 cm²) centred on each of 20484 sources; single-layer BEM; 28112 sensors per array; $\eta = 3$

Lines: area-weighted median per 2-mm depth bin (C: with interquartile range); dotted curves: sphere model; dotted line: d_{50} , where OPM is better for half of the cortex at that depth
